AB There are provided agents for controlling the function of a GPR34 receptor which contain compds. represented by the formula (I) [wherein ring A represents an optionally substituted homocycle or heterocycle; P represents a bond or spacer; ring D represents an optionally substituted, monocyclic aromatic ring optionally fused to a 5- to 7-membered ring; V represents a bond or a group represented by -CR14:CR15- or -N:CR16- (wherein R14, R15, and R16 each represents hydrogen or an optionally substituted hydrocarbon group); Q represents a bond or spacer; W represents carboxy or a group biol. equivalent to carboxy], salts of the compds., or prodrugs of either. These agents are useful for the prevention and/or treatment of immune diseases, inflammatory diseases, respiratory diseases, urol. diseases (urinary system diseases), central nervous system diseases, or cardiovascular diseases. Thus, 4-(4-chlorophenyl)-3-methyl-1-benzofuran-2-carboxylic acid was condensed with Me O-benzyl-L-tyrosinate hydrochloride using 1-ethyl-3-(3- dimethylaminopropyl)carbodiimide hydrochloride and HOBt in the presence of Et3N in a 1:1 mixture of DMF and CH2Cl2 (93% yield) followed by saponification with NaOH in aqueous methanol and acidification with 1 H aqueous HCl solution to give 28% O-benzyl-N-[[6-(4-chlorophenyl)-3-methyl-1-benzofuran-2-yl]carbonyl]-L- tyrosine (II). II in vitro showed antagonist activity against human GPR34 receptor expressed in CHO cells with IC50 of ≤1 μM. Pharmaceutical tablet formulations were described.

AB An immunosuppressive treatment combining a S1P receptor modulator, one or more immunosuppressive drug(s) and an antilymphocyte antibody in the course of the treatment of a transplant recipient prolongs the survival of a transplant allograft. Thus, the patients were administered (i) FTY720 5 mg given 2 to 12 h prior to renal allograft revascularization, then 2.5 mg daily, (ii) cyclosporine A 8 to 10 mg/kg/day adjusted to achieve target blood levels, and (iii) corticosteroids. The dosage regimen of the study had

a beneficial effect compared to standard immunosuppressive regimens.

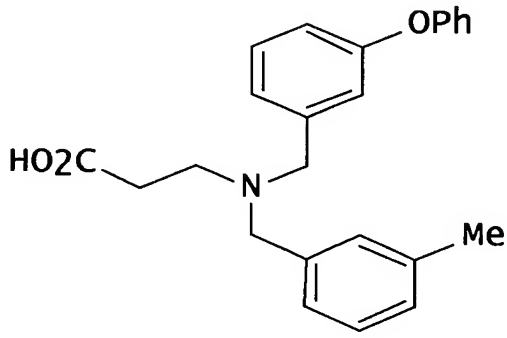
I



II

AB Compds. I [wherein Z = COOH, ester radical; ring A, B = (un)substituted monocyclic (hetero)aryl or cycloalkyl; X = O, S, CH2; R = (un)substituted monocyclic (hetero)aryl, cycloalkyl; etc., with exclusions, and salts, hydrates or solvates thereof] were prepared for use as antibacterial agents. Many N,N-disubstituted β-alanines were given as examples. For instance, DBU-mediated Michael addition of acrylate of Wang-OH resin with 3-methylbenzylamine

followed by reductive amination with 3-phenoxybenzaldehyde in the presence of NaBH(OAc)3 and HOAc, and subsequent cleavage with TFA gave amino acid II·TFA in 80% overall yield. The tested compds. I were observed to inhibit bacterial cell division, and to produce a filamentous phenotype, i.e., having an average cell length in cultures greater than or equal to twice the average cell length in control culture. Some I showed MICs of 16-64 μg/mL against bacillus subtilis 168 by the broth microdilution method.

I

AB The present invention is related to the use of substituted methylene amide derivs. for the treatment and/or prevention of cardiovascular disorders such as coronary obstruction and heart failure and/or prevention of endothelial dysfunction in heart failure.. A methylene amide derivative I was able to acutely restore endothelial function in mice with chronic heart failure.

AB Disclosed is a compd. capable of binding sphingosine 1-phosphate receptors (S1P receptors), especially EDG-6, preferably EDG-1 and EDG-6. For example, a compound of the general formula (R1)mAnXBYCOOH (wherein A is a cyclic group; B is an optionally substituted cyclic group; X is a spacer with a main

chain of 1 to 8 atoms, etc.; Y is a spacer with a main chain of 1 to 10 atoms, etc.; and n is 0 or 1 provided that when n is 0, m is 1 and R1 is a hydrogen atom or a substituent and that when n is 1, m is 0 or an integer of 1 to 7 and R1 is a substituent, in which when m is 2 or greater, R1s may be identical with or different from each other), its salt or solvate, or a prodrug thereof is capable of binding S1P receptors (especially EDG-6, preferably EDG-1 and EDG-6) and is thus useful in the prevention and/or treatment of immunol. reaction to transplant, graft vs. host disease, autoimmune disease, allergosis, etc. For example, 3-[3-[4-(5-phenylpentyloxy)phenyl]propylamino]propanoic acid (I) was prepared, and examined for its EDG-6 receptor binding activity in in vitro. Also, a tablet containing I 10 mg/tablet was formulated.

I

AB Benzamides, such as I [R = OH, NH2, alkoxy, alkylamino, etc.; R1 = H, alkyl, benzyl, etc.; W = alkylene, aryl substituted alkylene; Z = benzyl, biphenylmethyl, phenylalkyl, etc.], were prepared for use in the prophylactic and/or curative treatment of a condition or a disease mediated by the PPARγ. These benzamides are claimed for use in the treatment of metabolic diseases, such as non-insulin-dependent diabetes mellitus, obesity, hypercholesterolemia and other lipid-mediated pathologies, as well as for treatment of cardiovascular disease associated with metabolic syndrome, treatment of inflammation or an inflammatory processes, such as rheumatoid arthritis, atherosclerosis, psoriasis and intestinal inflammatory disease, for treatment of cancer, skin wound healing or cutaneous disorders associated with an anomalous differentiation of epidermic cells, and for treatment of bone disease, particularly osteoporosis. Thus, the L-phenylalanine derivative, (S)-PhCH2O-4-C6H4CH2CH(CO2Me)NHCOC6H4-4-OCH2C6H4-4-OPh, is an example of the target benzamides prepared The prepared benzamides were assayed for PPARγ binding affinity and were evaluated for their PPARγ agonist/antagonist functional activity.
